

Unidentified White female

Located on May 8, 1998 in Hancock County, Mississippi.

Manner of death was a pedestrian vs. automobile accident. Cause of death was multiple injuries of blunt impact. Death occurred minutes after being hit.

---

#### Vital Statistics

Estimated age: 37 - 42 years old

Approximate Height and Weight: 5'3½" (161 cm.); 130-135 lbs. (59-61 kg.)

Distinguishing Characteristics: 16-18 inch-long, curly reddish-brown hair with a touch of gray at the temples and front. Her natural hair color was brown, but had been dyed a slightly lighter color. She had uniquely-colored gray eyes. The victim had a vaccination scar on her left arm and an old hysterotomy scar from a C-section running from her navel down to her pubis. Closer examination revealed that the woman had given birth to at least 2 children, perhaps more. Her ears were not pierced. There were no signs of alcohol or drugs in her system. Seven "Ephedrine-Guaifenefine MINI" pills were found in her right back jean pocket. She suffered from black lung disease, emphysema and chronic bronchitis. Thick mucus was present in her lungs. The victim was tan and freckled; bug bites were present on her body. Her legs and underarms were unshaven. Her fingernails and toenails were short, uneven and dirty. There was a black, greasy smudge on the medial right foot from the base of the first toe into the arch.

Dentals: She had no teeth or dentures.

Clothing: She was wearing Bongo jeans, a black, hooded Spalding Activewear sweatshirt with Florida on the front and blue velvet slippers. No socks or underwear.

---

#### Case History

The victim was found 230 ft. off of the eastbound lane of 1-10, near Exit 2, Mile Marker #4 in Hancock County, Mississippi.

She was found face down, her head towards a wooded area, slanting in grassy area. A group of teenagers traveling in a 1998 green Mitsubishi had thought that they had hit a deer. This happened between 2 am. and 3 am., however the victim was not discovered until 10:40 am by a trucker.

After hearing of the unidentified woman being hit, the subjects who hit her came forward.

The victim had been flung approximately 230 ft. away from the interstate when she was hit.

An autopsy was performed and it was found that she had recently eaten. French fries and pickle slices (as well as a thick brown liquid), but no meat, was found in the esophagus and stomach.

She had numerous small hydatid cysts in her oviducts. Hydatid cysts are caused from a parasite that is accidentally ingested when consuming contaminated/unsanitary food. The victim also had moderate osteoarthritis in her spine, as well as numerous gashes and lacerations over most of her body. She suffered 21 broken ribs as well as a lacerated liver.

Cause of death was a fracture of the cervical spine, compression-contusion of the spinal cord, lacerated abraded scalp, a deep laceration of the right popliteal region and left heel, a fractured right femur and multiple deep abrasions of the trunk, extremities and face. There was a hair resembling the scalp hair entangled in the fingers of the left hand.

Thousands of inquiries have been made about this individual, but she has not been identified as of this date.
